SELENIUM PROJECT

Project on INFINITE Scrolling on Nike using Python and Selenium

Implementing infinite scrolling on Nike's men's shoes section using Python and Selenium involves automating the process of scrolling and loading more products dynamically.

Here's an overview of the general steps:

Import Required Libraries:
Begin by importing the necessary libraries, including selenium for browser automation.

Set Up Selenium WebDriver:
Set up the Selenium WebDriver for the desired browser (e.g., Chrome) to automate browser interactions.

Open the Webpage:
Use the WebDriver to open the URL of Nike's men's shoes section.

Scroll and Load More Data:
Implement a loop to continuously scroll down the webpage and load more products. You can use JavaScript commands to simulate scrolling behavior. Check the webpage for specific elements or indicators that signify the end of the current product list and the loading of additional products.
